THE COMMODITY STATISTICS OF THE INDUSTRY AND MERCHANDISING DIVISION(OTHER THAN CENSUS OF INDUSTRY)

The backbone of the work of the Industry and Merchandising Division consists of regular annual surveys. The main one is the Census of Industry which covers manufacturing, mining, forestry and the fisheries. Ancillary to this is the survey of manufacturing shipments and inventories. Another major group of annual and biennial surveys covers wholesale and retail trade, together with a number of service trades.

Information about individual commodities forms a prominent part of the Census of Industry. For most industries, considerable detail is given both on the products made, and on the materials used. Information on a commodity basis is also being increasingly sought in the Division's other annual surveys.

Commodity data collected in the case of manufacturing industry, by the Census of Industry, are collated in the Central Assembly Unit, which maintains detailed card index systems for products made and materials used. Data on shipments of individual commodities are given in General Review of the Manufacturing Industries of Canada, and in Preliminary Statement of Manufactures.

The range of data collected by the Industry and Merchandising Division outside its normal census work is considerable. Most of the surveys concerned are monthly ones which provide data for a number of purposes. Most of the results are published, which means that general knowledge of the working of the economy is increased, in addition to any specific purpose for which a government department may require the figures. The monthly coal statistics, for example, are used by the Dominion Coal Board for administrative purposes, but they are also of general interest. Some series are collected primarily for the economist. The monthly telegraphic reports on the production of steel and automobiles, for instance, provide valuable indicators of current economic activity.

Some information is collected annually in order to provide an early estimate of production, in advance of the regular Census of Industry reports. The annual production of certain minerals, for instance, is asked for on a special early schedule so that the Preliminary Estimate of Canada's Mineral Production can be published a day or so after the end of the year in question. Data for some other minerals covered by this

publication are obtained from the monthly reports. In other cases, a special survey may be used to obtain an early figure for the annual production of a commodity, such as sulphuric acid or vacuum cleaners. Special surveys may also be used for specific purposes, such as the sales of pest control products (annual) or the use of chemicals by municipal waterworks (biennial). Other data are collected at varying intervals.

Although most of the data are published, there is a good deal of unpublished information, all of which is used by one or more groups of persons. In some cases, the data from an individual survey are combined with other material in the Bureau, and form part of a consolidated result. In all other cases, at least one government department is likely to be interested. In many cases, the tabulated results of the survey are made available to the respondents.

Always subject to the over-riding need to protect the interests of individual firms, it would appear that many users of statistics could obtain more information than they do at present, if they knew where to look for it. It is hoped that, by study of this memorandum, they may learn some new places in which to look. This applies, not only to unpublished material, but also to the material which is available regularly in the form of special statements.

This memorandum provides a systematic guide to those commodity statistics of the Division which do not form part of the regular annual Census of Industry. Commodity statistics are regarded here as those which apply to a specified commodity or group of commodities, and are collected as such. Statistics of an industry, which is itself defined in terms of commodities, are not regarded as commodity statistics.

It was felt that the reader will be sufficiently familiar with the annual Census of Industry reports to need no special guide to the commodity statistics contained in them. If any problem arises, reference to the alphabetical index of the Standard Industrial Classification Manual should resolve it.

The memorandum is laid out on the lines of the volumes, parts and sections of the annual Census of Industry reports. Commodity data from other surveys are arranged under the

reference of the volume in which statistics are given of the industry which produces the product and consumes these materials. A strict arrangement by commodities would not be practicable, because one schedule may deal with a wide variety, including both materials used and products made.

This basic unit for the presentation is the form on which the data are collected, or an alternative medium such as regular telegrams or letters. For each form used to collect commodity data (other than regular Census of Industry forms) a summary of the data collected is given in the left-hand column. The next column lists the concepts covered. An economist interested primarily in production, or stocks, could scan this column and check any line dealing with the concept required. The third column shows the periodicity. Here, again, the reader could scan for monthlies only, for example. The fourth

column indicates whether the data are available in terms of quantity, value or both. The fifth column gives the name of the form, together with a reference number which is likely to be of interest only within D.B.S. Users of statistics might find it useful to obtain blank copies of forms used within their fields of interest, as this gives a good idea of what data are likely to exist. Of course, not all the information which is collected can be made available, because the interests of individual firms must be protected. The sixth column shows where the published data are to be found. The seventh column gives any necessary comments. At the top of each page is the name of the section which handles the data shown on that page. In some cases, a different section is named for individual forms lower down. The names and telephone numbers of the chiefs of the sections named in this memorandum are as follows:
